

5. Conclusion

As the use of mobile ad hoc networks (MANETs) has increased, the security in MANETs has also become more important accordingly. Historical events show that prevention alone, i.e., cryptography and authentication are not enough; therefore, the intrusion detection systems are brought into consideration. In this survey, we have given different existing intrusion detection techniques and also introduce new innovative intrusion detection technique Hybrid Cryptography (BECDH) for finding malicious nodes in MANETs. Finally, we have justified that hybrid cryptography technique (BECDH) is better intrusion detection system for mobile ad hoc network while compared with other existing intrusion detections systems.
